

Question

The maximum and minimum magnitudes of the resultant of two forces are 35 N and 5 N respectively. Find the magnitude of resultant force when act orthogonally (Perpendicularly) to each other.

$$\begin{aligned} A + B &= 35 \\ A - B &= 5 \end{aligned}$$

$$\begin{aligned} A &= 20 \\ B &= 15 \end{aligned}$$

$$Ans = \sqrt{20^2 + (5)^2} = 5 \times 5 = 25$$

Question

Two equal forces (P each) act at a point inclined to each other at an angle of 120° .
The magnitude of their resultant is

$$= \sqrt{P^2 + P^2 + 2 \cdot P \cdot P \cdot \cos 120^\circ}$$

A $\frac{P}{2}$

B $\frac{P}{4}$

C P

D $2P$

Ans : (C)

Question

Maximum and minimum magnitudes of the resultant of two vectors of magnitudes P and Q are in the ratio 3 : 1. Which of the following relations is true?

A

$$P = 2Q$$

B

$$P = Q$$

C

$$PQ = 1$$

D

None of these

$$\frac{P+Q}{P-Q} = \frac{3}{1}$$

$$P + Q = 3P - 3Q$$

$$4Q = 2P$$

$$P = 2Q$$

Ans : (A)

Question

For the resultant of the two vectors to be maximum, what must be the angle between them

3. Suppose you are told that the linear size of everything in the universe has been doubled overnight. Can you test this statement by measuring sizes with a metre stick? Can you test it by using the fact that the speed of light is a universal constant and has not changed? What will happen if all the clocks in the universe also start running at half the speed?
4. If all the terms in an equation have same units, is it necessary that they have same dimensions? If all the terms in an equation have same dimensions, is it necessary that they have same units?
5. If two quantities have same dimensions, do they represent same physical content?
6. It is desirable that the standards of units be easily available, invariable, indestructible and easily reproducible. If we use foot of a person as a standard unit of length, which of the above features are present and which are not?
7. Suggest a way to measure:
 - (a) the thickness of a sheet of paper,
 - (b) the distance between the sun and the moon.

OBJECTIVE I

1. Which of the following sets cannot enter into the list of fundamental quantities in any system of units?
 - (a) length, mass and velocity,
 - (b) length, time and velocity,
 - (c) mass, time and velocity,
 - (d) length, time and mass.
2. A physical quantity is measured and the result is expressed as nu where u is the unit used and n is the numerical value. If the result is expressed in various units then
 - (a) $n \sim \text{size of } u$
 - (b) $n \sim u^3$
 - (c) $n \sim \sqrt{u}$
 - (d) $n \sim \frac{1}{u}$
3. Suppose a quantity x can be dimensionally represented in terms of M , L and T , that is, $[x] = M^a L^b T^c$. The quantity mass
 - (a) can always be dimensionally represented in terms of L , T and x ,
 - (b) can never be dimensionally represented in terms of
4. A dimensionless quantity
 - (a) never has a unit,
 - (b) always has a unit,
 - (c) may have a unit,
 - (d) does not exist.
5. A unitless quantity
 - (a) never has a nonzero dimension,
 - (b) always has a nonzero dimension,
 - (c) may have a nonzero dimension,
 - (d) does not exist.
6.
$$\int \frac{dx}{\sqrt{2ax - x^2}} = a^n \sin^{-1} \left[\frac{x}{a} - 1 \right].$$
The value of n is
 - (a) 0
 - (b) -1
 - (c) 1
 - (d) none of these.You may use dimensional analysis to solve the problem.

OBJECTIVE II

1. The dimensions $ML^{-1}T^{-2}$ may correspond to
 - (a) work done by a force
 - (b) linear momentum
 - (c) pressure
 - (d) energy per unit volume.
2. Choose the correct statement(s):
 - (a) A dimensionally correct equation may be correct.
 - (b) A dimensionally correct equation may be incorrect.
 - (c) A dimensionally incorrect equation may be correct.
 - (d) A dimensionally incorrect equation may be incorrect.
3. Choose the correct statement(s):
 - (a) All quantities may be represented dimensionally in terms of the base quantities.
 - (b) A base quantity cannot be represented dimensionally in terms of the rest of the base quantities.
 - (c) The dimension of a base quantity in other base quantities is always zero.
 - (d) The dimension of a derived quantity is never zero in any base quantity.

EXERCISES

1. Find the dimensions of
 - (a) linear momentum,
 - (b) frequency and
 - (c) pressure.
2. Find the dimensions of
 - (a) angular speed ω ,
 - (b) angular acceleration α ,
 - (c) torque Γ and
 - (d) moment of inertia I .Some of the equations involving these quantities are

$$\omega = \frac{\theta_2 - \theta_1}{t_2 - t_1}, \quad \alpha = \frac{\theta_2 - \theta_1}{t_2 - t_1}, \quad F = Fr \text{ and } I = mr^2.$$

The symbols have standard meanings.

3. Find the dimensions of

- (a) electric field E ,
- (b) magnetic field B and
- (c) magnetic permeability μ_s .

The relevant equations are

$$F = qE, \quad F = quB, \quad \text{and} \quad B = \frac{\mu_s I}{2\pi a};$$

where F is force, q is charge, v is speed, I is current, and a is distance.

4. Find the dimensions of

- (a) electric dipole moment p and
- (b) magnetic dipole moment M .

The defining equations are $p = qd$ and $M = IA$; where d is distance, A is area, q is charge and I is current.

5. Find the dimensions of Planck's constant h from the equation $E = hv$ where E is the energy and v is the frequency.

6. Find the dimensions of

- (a) the specific heat capacity c ,
- (b) the coefficient of linear expansion α and
- (c) the gas constant R .

Some of the equations involving these quantities are $Q = mc(T_2 - T_1)$, $I_t = I_d[1 + \alpha(T_2 - T_1)]$ and $PV = nRT$.

7. Taking force, length and time to be the fundamental quantities find the dimensions of

- (a) density,
- (b) pressure,
- (c) momentum and
- (d) energy.

8. Suppose the acceleration due to gravity at a place is 10 m/s^2 . Find its value in cm/(minute) 2 .

9. The average speed of a snail is 0.020 miles/hour and that of a leopard is 70 miles/hour. Convert these speeds in SI units.

10. The height of mercury column in a barometer in a Calcutta laboratory was recorded to be 75 cm. Calculate this pressure in SI and CGS units using the following data : Specific gravity of mercury = 13.6 , Density of water = 10^3 kg/m^3 , $g = 9.8 \text{ m/s}^2$ at Calcutta. Pressure = $h\rho g$ in usual symbols.

11. Express the power of a 100 watt bulb in CGS unit.

12. The normal duration of I.Sc. Physics practical period in Indian colleges is 100 minutes. Express this period in microcenturies. $1 \text{ microcentury} = 10^{-6} \times 100 \text{ years}$. How many microcenturies did you sleep yesterday?

13. The surface tension of water is 72 dyne/cm. Convert it in SI unit.

14. The kinetic energy K of a rotating body depends on its moment of inertia I and its angular speed ω . Assuming the relation to be $K = kI^\alpha \omega^\beta$ where k is a dimensionless constant, find α and β . Moment of inertia of a sphere about its diameter is $\frac{2}{5}Mr^2$.

15. Theory of relativity reveals that mass can be converted into energy. The energy E so obtained is proportional to certain powers of mass m and the speed c of light. Guess a relation among the quantities using the method of dimensions.

16. Let I = current through a conductor, R = its resistance and V = potential difference across its ends. According to Ohm's law, product of two of these quantities equals the third. Obtain Ohm's law from dimensional analysis. Dimensional formulae for R and V are $ML^2I^{-1}T^{-2}$ and $ML^3T^{-3}I^{-1}$ respectively.

17. The frequency of vibration of a string depends on the length L between the nodes, the tension F in the string and its mass per unit length m . Guess the expression for its frequency from dimensional analysis.

18. Test if the following equations are dimensionally correct :

(a) $h = \frac{2S \cos\theta}{\rho g}$,	(b) $v = \sqrt{\frac{P}{\rho}}$,
(c) $V = \frac{\pi P r^4 t}{8\eta l}$,	(d) $v = \frac{1}{2\pi} \sqrt{\frac{mgf}{I}}$;

where h = height, S = surface tension, ρ = density, P = pressure, V = volume, η = coefficient of viscosity, v = frequency and I = moment of inertia.

19. Let x and a stand for distance. Is $\int \frac{dx}{\sqrt{a^2 - x^2}} - \frac{1}{a} \sin^{-1} \frac{x}{a}$ dimensionally correct ?
